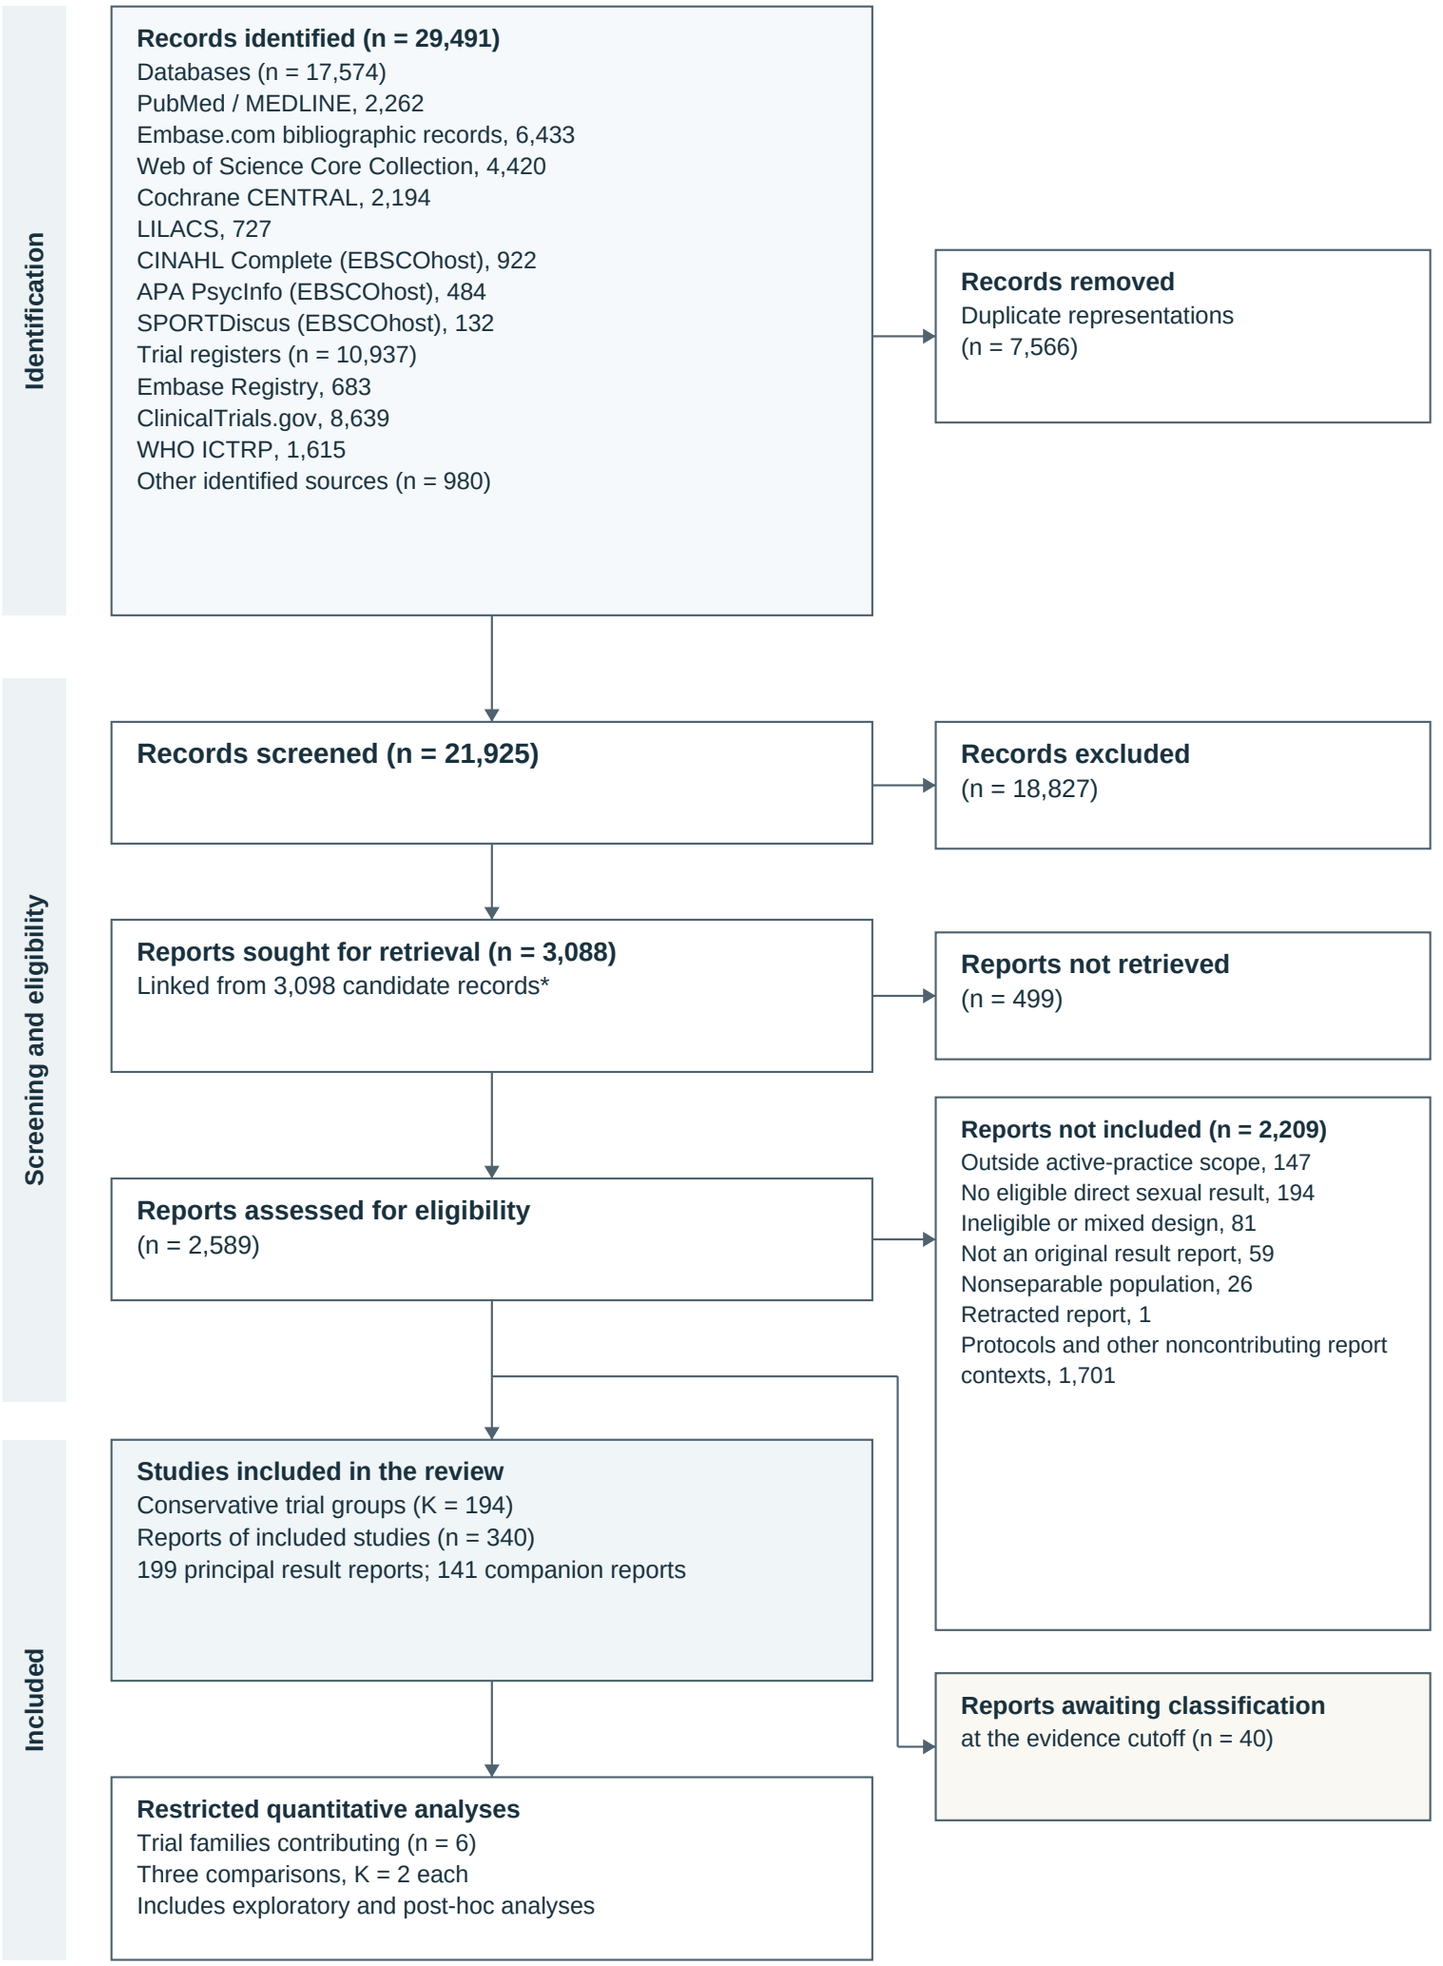
Figure 1 Study selection



* Record-to-report reconciliation: 3,098 - 1 proceedings container + 4 additional reports - 13 redundant representations (10 alias nodes and 3 many-to-one merges) = 3,088. Details appear in S1.

The included count covers complete bodily-practice programmes and defined adaptive physical-task offers. It does not identify an isolated exercise component effect.

Two suspected-dependency pairs (Yun 80/150 and Khoshnab 120/60) are grouped conservatively. Splitting one or both gives 195 or 196 groups; person-level overlap is unverified. Uncertain eligibility remains in the awaiting-classification branch.

Adapted from PRISMA 2020. Individual source scopes and report-level reasons are provided in S1 and S2.
